RESEARCH INTEREST

I'm a **fifth-year Ph.D. candidate** at Washington University in St. Louis advised by Prof. Yixin Chen. My research primarily focuses on **Graph Neural Networks (GNNs)**, **Few-shot Learning**, **Contrastive Learning**, and **Multimodal Learning**. I am also exploring tabular representation learning, particularly its application in addressing real-world clinical problems. Most recently, I have been working on developing a **graph foundation model** by leveraging the power of **Large Language Models (LLMs)**.

EDUCATION

Washington University in St. Louis   Saint Louis, MO
Ph.D. Candidate in Computer Science & Engineering   *Sep. 2019 – (Expected) June 2025*

Beijing Normal University   Beijing, China
B.S. in Mathematics   *Sep. 2015 – June 2019*

SELECTED RESEARCH PROJECTS

GOFA: A Generative One-For-All Model for Joint Graph Language Modeling Feb. 2024 – Present
- Designed a graph foundation model that integrates GNN layers with LLM layers, leveraging the generative strengths of LLMs for free-form output and the structural learning capabilities of GNNs.
- Pioneered a novel pretraining paradigm focused on graph-level next-token prediction, facilitating large-scale self-supervised learning on various text-attributed graphs.
- Achieved state-of-the-art zero-shot performance on six node/link/graph-level datasets after instruction fine-tuning on a small number of data, demonstrating its potential as a foundation model.

One for All: Training One Graph Model for All Classification Tasks   Mar. 2023 – Jan. 2024
- Developed the first graph foundation model capable of handling multiple classification tasks across various datasets and domains in supervised, few-shot, and zero-shot scenarios.
- Employed Large Language Models to standardize and unify graph data representation, transforming features of diverse graphs into consistent natural language formats, enabling multi-dataset training in the graph domain.
- Innovated a graph prompting paradigm, advancing the model's in-context learning capabilities.

Unsupervised Meta-Learning for Transductive Few-shot Node Tasks   Jan. 2023 – Oct. 2023
- Designed the first unsupervised meta-learning method for transductive few-shot node classification.
- Innovated an unsupervised meta-task construction method by leveraging the strengths of contrastive learning, enabling comprehensive use of graph nodes in the learning process.
- Achieved state-of-the-art performance on seven datasets, with at least 11.18% and up to 20.56% absolute accuracy improvement over existing meta-learning baselines.

TECHNICAL SKILLS

Programming Languages: Python, Matlab, C
Machine Learning Frameworks: PyTorch, Lightning, PyG (Graph Neural Networks), Scikit-learn
Data Science Tools: Pandas, NumPy, Matplotlib, Seaborn
Developer Tools: PyCharm, Jupyter Notebooks, Git, Docker, Google Cloud Platform, VS Code

WORK EXPERIENCE

Applied Research Intern   Capital One
Designed a graph foundation model that involves prompt information in GNN message passing.   June 2024 - Aug. 2024

TEACHING SERVICES

Washington University in St. Louis
CSE 543T: Nonlinear Optimization   *Lecturer/Grader— Spring 2023/Spring 2024*
